Development Test

Till Float Management

You have a till with a float of R500 made up of 5 x R50, 5 x R20, 6 x R10, 12 x R5, 10 x R2 and 10 x R1. You are given a list of transactions that you need to process and calculate change that you can give out of your till.

Each line in the input is a shopping experience that has the items and the amount paid separated by a comma and each item in separated by a semi-colon. Each item has a description and its amount. The amount paid on each line is separated by a dash with the denominations of money that was paid.

Put the inputs below in a file that your application will read in, process and output a file with the results similar to the Output below.

Input:

Fresh full cream milk R30;Free range large eggs R24,R20-R20-R20
Double cream plain yoghurt R38;Cheddar R42;Kiri cheese spread R33,R100-R100
Hake pickled fish R73,R100
Beef frikkadels R72;Chicken frikkadels R72;Nuggets R66,R100-R50-R50-R20-R20-R10 Beef samosas R56;Oak smoked salmon R230,R200-R50-R50
Cheese sliders R66,R50-R10-R5-R1
Bananas R20;Cucumber R15;Avocados R44,R50-R20-R10-R10
Potatoes R30;Apples R33;Carrots R13,R50-R20-R5-R1

Note: *No amounts have cents and the Output below is just a sample. Your solution does not need to be in the same order.*

As you process each input line you need to create a line in your output that shows what is currently in the till before this transaction, the total the transaction should cost, how much was paid, the total change given and a breakdown of that change into the currency denominations given.

Your last line of your output should be the amount left in the till.

Output:

Till Start, Transaction Total, Paid, Change Total, Change Breakdown
R500, R54, R60, R6, R2-R2-R2
R548, R113, R200, R87, R50-R20-R10-R5-R2
...

R1040
